

Is your agency building a new web application?

Does your agency's existing web site require improved web application security?

Do you need to safeguard sensitive agency or customer information?

SECURE GATEWAY

A proven, cost saving solution to meet your agency's web application security needs

The Arizona @ Your Service (AAYS) Secure Gateway is a proven, cost effective, flexible security solution for your agency's web applications. Secure Gateway provides a powerful 24x7 service for authenticating and authorizing web transactions for your agency while simplifying security administration tasks — at a fraction of the cost of developing and supporting your own security solution! You gain the benefits of a monitored, robust, centralized security infrastructure, and your security administrator retains control over your agency's security policies.

With Secure Gateway you gain a powerful security solution, you retain complete control of your security policies, and you save money.

BENEFITS

- Your agency gains a proven and powerful security solution.
- "On-demand" pricing saves your agency money.
- Utilizing a state-shared infrastructure reduces cost.
- Customers need only to sign on once to access all of your agency's web applications.
- Your agency application security administrator retains control of security policies.
- Secure Gateway improves workflow for your security administrator and for customers.
- Secure Gateway easily "plugs in" to your agency's web environment.
- Reduction of security concerns increases programmer productivity.
- Technical support is always available.

"On-Demand" Pricing Saves Your Agency Money

Because you pay for the Secure Gateway service on a monthly basis, you avoid costly initial investments in hardware and software as well as ongoing monitoring and security system management costs.

Shared Infrastructure Reduces Cost to Your Agency

Secure Gateway provides the necessary infrastructure to manage all of your agency's web application security needs. Because you don't have to provide the infrastructure (and because you don't have to develop and support a proprietary security solution), you save money.

Your Agency Retains Security Management Control

With Secure Gateway your agency benefits from a centralized shared security infrastructure and retains control of security administration. Secure Gateway provides your security administrators full, flexible control of customer access to your agency's applications and supports applications that require the following authentication mechanisms: Public Anonymous, User ID/Password, RSA SecurID, and Digital Certificates.

Single Sign-On Eliminates Need for Multiple Userids and Passwords

With Secure Gateway, the need for multiple userids and passwords for multiple agency web applications disappears. Secure Gateway allows your customers to sign on once and access all agency applications for which your customer is authorized. Once a customer signs on, Secure Gateway presents a personalized web page displaying icons only for those applications your customer is authorized to use.

Customers who log in through Secure Gateway to access your agency applications can also use the same userid and password to access Secure Gateway applications managed by other state agencies.

Web Security Workflow Is Improved

Secure Gateway eliminates the need for paper-based forms or unneeded email to administrators. Your agency's security administrator decides what information to

collect from customers, then, using the Secure Gateway service, creates a fully customizable registration page that is presented to the customer upon application registration. Your agency's administrator can accept or reject applications with a few mouse clicks.

Simply Plug It In to Secure New and Existing Applications

Adding Secure Gateway as your security solution is fast and simple and involves no risk. It quickly and easily "plugs in" to your environment to add instant web security to your agency's new or existing web applications.

Increase Programmer Productivity

Secure Gateway provides significant cost savings to your agency by eliminating approximately 10%–20% of application development costs; developers will not spend hours designing, coding, and testing complex authentication and authorization functions into their applications.

Technical Support Is Always Available

Technical assistance is available 24x7 to assist your security administrator.
